The InLine® Slimline SATA cable is a functional connection solution for optical drives with a slimline SATA connection. The 13-pin Slimline SATA connector combines data and power signals and enables the integration of corresponding drives into systems with standard SATA interfaces. Data is transferred via a SATA 7-pin connector, while the separate 2-pin power cable supplies the drive with power.

The separate cable routing allows the cables to be positioned flexibly in the housing, which supports structured installation. The cable lengths of approx. 0.4 m for the data line and approx. 0.15 m for the power line are designed for short internal connections and reduce unnecessary cable lengths. The cable is suitable for use in system configurations where slimline optical drives need to be reliably connected to standard SATA ports.

The robust design of the connectors supports stable installation and secure signal transmission. This makes the cable suitable for applications that require compact and clear internal cabling. It complements existing systems with an efficient connection solution specifically for slimline optical drives.
